Enterprise Data Integration: Foundation Training

Today, many Organisations like yours use different software applications to drive specific aspects of their business like Accounting, Billing, Manufacturing, Logistics & Distribution, Project Management, Customer Relationship Management, Treasury, Investment, etc.

Typically, data generated from any one of the applications serves as input or may need to be combined or aggregated with data from one or more of your other applications to provide you with a rich single view of your business.

Achieving this data combination, aggregation, Integration and transformation requirements however continues to be a herculean task for many people.

Course Objective:

This course is designed to introduce participants to the extensive features and functionality available in SunSystems to help you easily achieve all your data exchange, transformation, combination & integration requirements while working with multiple applications.

Who should Attend:

Anyone in your organisation who needs to export, import or combine SunSystems data with data from one or more 3rd party software applications.

What will you learn/Course Benefits:

- Using the SunSystems data transformation tools to take on data from third party applications into SunSystems
- Using the SunSystems data transformation tools to prepare SunSystems and any other Application's data for transfer into other applications
- Integration of your core systems across the business and creation of a wide area value network
- Realising the benefits of an ERP without spending the high cost of acquiring or implementing an ERP

Prerequisites: Basic knowledge of SunSystems, familiarity with data integration and interface requirements of your organisation.

Date: 19th – 21st October, 2011

Course Fee: N173,757.00
